Supporting Choice and Care

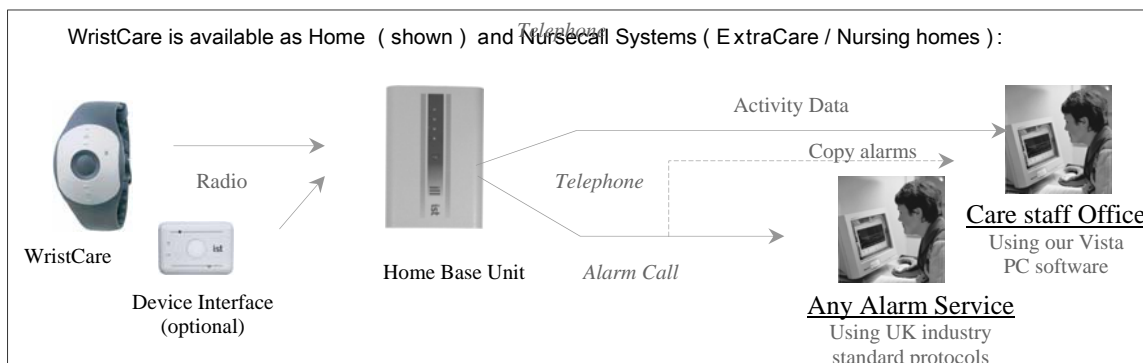

WristCare is the only Assistive Technology which *protects* its users *and* supports *preventative* care.

1.	Wants help	Unlike most community alarm, WristCare is worn in bed, providing a manual alarm button even at night.
2.	Unconscious*	Using Artificial Intelligence and bio sensors in the wrist unit. <small>*Read our documentation for important details.</small>
3.	Not wearing it	WristCare automatically checks that it is being worn. In long term test, WristCare was worn 94% of the time.
4.	Leaves home	Intelligent wandering detection that distinguishes between client and carer.

Activity Data

WristCare supports preventative care by measuring wellness. Users' Activity Data are sent to care staff to support better care planning.

Alarms and Activity Data can be adjusted, activated, deactivated and sent to different locations according to each user's need.

Would your clients benefit?

If so, contact us now for a free demonstration:
